Seeing and reading this sentence may seem like a "no brainer"--but your perception is just a tiny part of what is happening in your brain and body right now (both are much busier than you might think). SENSATION AND PERCEPTION has helped many readers understand the ties between how we sense the world and how the body interprets these senses. A key strength of this book has always been the ability to illustrate concepts through examples and visuals. Dr. Goldstein walks you through an intriguing journey of the senses, combining clear writing, his extensive classroom experience, and innovative research to create a visual, colorful book.

This innovative text uses an integrative theme, levels of analysis, to help students make sense of psychology, its subdisciplines, and its relationship to other fields of study. In every chapter, Goldstein shows students how behavioral, cognitive, biological, and contextual levels of analysis, and their dynamic interplay, contribute to an understanding of the complexity of human behavior. More focused on integrating information than any other text currently available, Goldstein's text presents a coherent overview of a very diverse academic discipline, helps students see the relevance of the science of psychology to their everyday life experiences, and helps them develop the capacity to think critically

about psychological claims.

This popular text gives students a comprehensive and readable introduction to contemporary issues in learning and behaviour, while providing balanced coverage of classical and instrumental conditioning.

Cognitive Psychology: Theory, Process, and Methodology introduces readers to the main topics of study in this exciting field through an engaging presentation of how cognitive processes have been and continue to be studied by researchers. Using a reader-friendly writing style and focusing on methodology, authors Dawn M. McBride and J. Cooper Cutting cover such core content as perception, attention, memory, language, reasoning and problem solving, and cognitive neuroscience. Updates to the Second Edition include a reorganization of long-term memory topics to improve readability, revised pedagogical tools throughout, a refreshed visual program, and additional real-life examples to enhance understanding. Because of the ease with which we perceive, many people see perception as something that "just happens." However, even seemingly simple perceptual experiences involve complex underlying mechanisms, which are often hidden from our conscious experience. These mechanisms are being investigated by researchers and theorists in fields such as psychology, cognitive science, neuroscience, computer science, and philosophy. A few examples of the questions posed by these investigations are, What do infants perceive? How does perception develop? What do perceptual disorders reveal about normal functioning? How can information from one sense, such as hearing, be affected by information from another sense, such as vision? How is the information from all of our senses combined to result in our perception of a coherent environment? What are some practical outcomes of basic research in perception?

An accessible and engaging account of the mind and its connection to the brain. The mind encompasses everything we experience, and these experiences are created by the brain--often without our awareness. Experience is private; we can't know the minds of others. But we also don't know what is happening in our own minds. In this book, E. Bruce Goldstein offers an accessible and engaging account of the mind and its connection to the brain. He takes as his starting point two central questions--what is the mind? and what is consciousness?--and leads readers through topics that range from conceptions of the mind in popular culture to the wiring system of the brain. Throughout, he draws on the latest research, explaining its significance and relevance.

Why a book on gender issues in mathematics in the 21st century? Several factors have influenced the undertaking of this project by the editors. First, an international volume focusing on gender and mathematics has not appeared since publication of papers emerging from the 1996 International Congress on Mathematical Education (Keitel, 1998). Surely it was time for an updated look at this critical area of mathematics education. Second, we have had lively discussion and working groups on gender issues at conferences of the International Group for the Psychology of Mathematics Education [PME] for the past four years, sessions at which stimulating and ground-breaking research has been discussed by participants from many different countries. Some publication seemed essential to share this new knowledge emerging from a wider variety of

countries and from different cultural perspectives. Third, some western countries such as Australia and the USA have experienced in recent years a focus on the “boy problem,” with an underlying assumption that issues of females and mathematics have been solved and are no longer worthy of interest. Thus it seemed timely to look more closely at the issue of gender and mathematics internationally. When the idea for this volume first emerged, invitations were issued to those regularly attending the working and discussion groups at PME. Potential authors were charged to focus on gender issues in mathematics and were given wide scope to hone in on the issues that were central to their own research efforts, or were in receipt or in need of close attention in their own national or regional contexts.

This book presents a coherent overview of cognitive psychology organized by

themes that cut across topic areas. Written by well-known researchers, it is up-to-date in describing ongoing controversies in research, providing summaries of key experiments that distinguish between them and promoting thinking critically about current research and theories. The focus on the importance of physical and computational constraints on cognition is preserved throughout the book.

A proposal for a new way to do cognitive science argues that cognition should be described in terms of agent-environment dynamics rather than computation and representation. While philosophers of mind have been arguing over the status of mental representations in cognitive science, cognitive scientists have been quietly engaged in studying perception, action, and cognition without explaining them in terms of mental representation. In this book, Anthony Chemero describes this nonrepresentational approach (which he terms radical embodied cognitive science), puts it in historical and conceptual context, and applies it to traditional problems in the philosophy of mind. Radical embodied cognitive science is a direct descendant of the American naturalist psychology of William James and John Dewey, and follows them in viewing perception and cognition to be understandable only in terms of action in the environment. Chemero argues that cognition should be described in terms of agent-environment dynamics rather than in terms of computation and representation. After outlining this orientation to cognition, Chemero proposes a methodology: dynamical systems theory, which would explain things dynamically and without reference to representation. He also advances a

background theory: Gibsonian ecological psychology, “shored up” and clarified. Chemero then looks at some traditional philosophical problems (reductionism, epistemological skepticism, metaphysical realism, consciousness) through the lens of radical embodied cognitive science and concludes that the comparative ease with which it resolves these problems, combined with its empirical promise, makes this approach to cognitive science a rewarding one. “Jerry Fodor is my favorite philosopher,” Chemero writes in his preface, adding, “I think that Jerry Fodor is wrong about nearly everything.” With this book, Chemero explains nonrepresentational, dynamical, ecological cognitive science as clearly and as rigorously as Jerry Fodor explained computational cognitive science in his classic work *The Language of Thought*.

For more than 30 years, numerous independent reviewers, student advice writers and even competitors have heralded HERGENHAHN'S AN INTRODUCTION TO THE HISTORY OF PSYCHOLOGY as the best in the field--and for good reason. It was the first History of Psychology text to include basic pedagogy--elements such as summaries and study questions that several current alternatives still lack. It engages students with interesting biographical tidbits--the fun facts that readers fondly remember after other details fade. Grounded in original source material and contemporary scholarship, the book provides breadth and depth of analysis unrivaled by works of similar length. In the eighth edition, author Tracy Henley continues to demonstrate that most of the concerns of contemporary psychologists are manifestations of themes that have been part of Psychology for hundreds--or even thousands--of years.
