Industrial Safety And Health Management is ideal for senior/graduate-level courses in Industrial Safety, Industrial Engineering, Industrial Technology, and Operations Management. It is useful for industrial engineers. Unique in approach, Industrial Safety and Health Management, 6th Edition combines — in one volume — an exploration of the time-tested concepts and techniques of safety and health management, a modern perspective on compliance with mandatory standards for workplace safety and health, and a variety of solved problems, case studies, and exercises. It provides reasons, explanations, and illustrations of the hazard mechanisms that form the underlying basis for the volumes of detailed standards for workplace safety and health. The new edition focuses on more of the real issues future safety and health practitioners will encounter, such as dealing with enforcement, protecting workers from ergonomic hazards, and accommodating the latest advances in process technology.

First published in 1963, this book is the second of two volumes which bridge the gap between the study of classics and the study of literature and attempt to reconcile the two disciplines. Focusing on satire, this collection of essays offers a critical examination of Latin literature and aims to stimulate critical discussion of a selection of Latin poets. This experimental and ground-breaking book will be of particular interest to students of Roman Literature, Classics and Poetry.

A brilliant analysis of the transition in world economics, finance, and power as the era of globalization ends and gives way to new power centers and institutions. The world is at a turning point similar to the fall of communism. Then, many focused on the collapse itself, and failed to see that a bigger trend, globalization, was about to take hold. The benefits of globalization--through the freer flow of money, people, ideas, and trade--have been many. But rather than a world that is flat, what has emerged is one of jagged peaks and rough, deep valleys characterized by wealth inequality, indebtedness, political recession, and imbalances across the world's economies. These peaks and valleys are undergoing what Michael O'Sullivan calls "the levelling"--a major transition in world economics, finance, and power. What's next is a levelling-out of wealth between poor and rich countries, of power between nations and regions, of political accountability from elites to the people, and of institutional power away from central banks and defunct twentieth-century institutions such as the WTO and the IMF. O'Sullivan then moves to ways we can develop new, pragmatic solutions to such critical problems as political discontent, stunted economic growth, the productive functioning of finance, and political-economic structures that serve broader needs. The Levelling comes at a crucial time in the rise and fall of nations. It has special importance for the US as its place in the world undergoes radical change--the ebbing of influence, profound questions over its economic model, societal decay, and the turmoil of public life.

This work offers a concise, but in-depth coverage of all fundamental topics of engineering economics.

This Handbook captures the salient features of Middle Eastern economies and critically examines the public policy responses required to address the challenges and opportunities across the region. Bringing together wide-ranging perspectives from carefully selected and renowned subject specialists, the collection fills a gap in this relatively young and growing academic field. Combining discussion of theory and empirical evidence, the book maps out the evolution of Middle East economics as a field within area studies and applied development economics. Presented in six thematic sections, the book enables the reader to gain a comprehensive understanding of the region's main economic themes and issues: • Growth and development in comparative perspectives • Labour force and human development • Natural resources, resource curse and trade • Poverty, inequality and social policy • Institutions and transition to democracy • Corruption, conflict and refugees Providing an overview of the principal economic problems, policies and performances relating to the countries in the Middle East and North Africa region, this collection will be a key resource for upper-level undergraduates, graduates and scholars with an interest in Middle East economics, applied development economics, development studies and area studies.

Praised for its accessible tone and extensive problem sets, this trusted text familiarizes students with the universal principles of engineering economics. This essential introduction features a wealth of specific Canadian examples and has been fully updated with new coverage of inflation and environmental stewardship as well as a new chapter on project management.

A comprehensive and rigorous introduction to thermal system design from a contemporary perspective Thermal Design and Optimization offers readers a lucid introduction to the latest methodologies for the design of thermal systems and emphasizes engineering economics, system simulation, and optimization methods. The methods of exergy analysis, entropy generation minimization, and thermoeconomics are incorporated in an evolutionary manner. This book is one of the few sources available that addresses the recommendations of the Accreditation Board for Engineering and Technology for new courses in design engineering. Intended for classroom use as well as self-study, the text provides a review of fundamental concepts, extensive reference lists, end-of-chapter problem sets, helpful appendices, and a comprehensive case study that is followed throughout the text. Contents include: \* Introduction to Thermal System Design \* Thermodynamics, Modeling, and Design Analysis \* Exergy Analysis \* Heat Transfer, Modeling, and Design Analysis \* Applications with Heat and Fluid Flow \* Applications with Thermodynamics and Heat and Fluid Flow \* Economic Analysis \* Thermoeconomic Analysis and Evaluation \* Thermoeconomic Optimization Thermal Design

and Optimization offers engineering students, practicing engineers, and technical managers a comprehensive and rigorous introduction to thermal system design and optimization from a distinctly contemporary perspective. Unlike traditional books that are largely oriented toward design analysis and components, this forward-thinking book aligns itself with an increasing number of active designers who believe that more effective, system-oriented design methods are needed. Thermal Design and Optimization offers a lucid presentation of thermodynamics, heat transfer, and fluid mechanics as they are applied to the design of thermal systems. This book broadens the scope of engineering design by placing a strong emphasis on engineering economics, system simulation, and optimization techniques. Opening with a concise review of fundamentals, it develops design methods within a framework of industrial applications that gradually increase in complexity. These applications include, among others, power generation by large and small systems, and cryogenic systems for the manufacturing, chemical, and food processing industries. This unique book draws on the best contemporary thinking about design and design methodology, including discussions of concurrent design and quality function deployment. Recent developments based on the second law of thermodynamics are also included, especially the use of exergy analysis, entropy generation minimization, and thermo economics. To demonstrate the application of important design principles introduced, a single case study involving the design of a cogeneration system is followed throughout the book. In addition, Thermal Design and Optimization is one of the best newsources available for meeting the recommendations of the Accreditation Board for Engineering and Technology for more design emphasis in engineering curricula. Supported by extensive reference lists, end-of-chapter problem sets, and helpful appendices, this is a superb text for both the classroom and self-study, and for use in industrial design, development, and research. A detailed solutions manual is available from the publisher.

Climate change represents the most important environmental challenge of our time. Organisations are responding by implementing governance processes and taking action to reduce their own emissions and the emissions from their supply chains and value chains. Yet very little is known about how these efforts contribute to reducing greenhouse gas emissions (if, indeed, they make any substantive contribution at all) or about how they might be harnessed to deliver more ambitious reductions in emissions. This book explains when and where particular forms of governance intervention – including internal governance processes and external governance pressures – are likely to impact climate change.

From this analysis, it offers practical proposals on the climate policy frameworks that need to be in place to facilitate or accelerate changes in corporate behaviour. The book is truly global: it focuses on the world's 25 largest retailers (including Walmart, Tesco, Carrefour, Sears and Aldi) and is based on detailed interviews with senior managers from these corporations, and with key global and national NGOs, corporate responsibility experts, politicians and regulators. These interviews provide clear insights into how external governance pressures and actions (public opinion, regulation, incentives) interact with internal governance conditions (management systems and processes, corporate policies, board/CEO leadership) to change and shape corporate actions on climate change and, in turn, the climate change impacts of these corporations. This book can be used as a core reference for any courses dealing with corporate governance and business strategy, in particular those relating to climate change and to environmental management more generally. It is also of relevance to business practitioners, public policy makers, investors and NGOs interested in ensuring that companies play a constructive role in the transition to a low-carbon economy.

Divided into four parts: circuits, electronics, digital systems, and electromagnetics, this text provides an understanding of the fundamental principles on which modern electrical engineering is based. It is suitable for a variety of electrical engineering courses, and can also be used as a text for an introduction to electrical engineering.

**WINNER OF THE 2007 CHLA BOOK AWARD!** Children's literature has transcended linguistic and cultural borders since books and magazines for young readers were first produced, with popular books translated throughout the world. Emer O'Sullivan traces the history of comparative children's literature studies, from the enthusiastic internationalism of the post-war period – which set out from the idea of a supra-national world republic of childhood – to modern comparative criticism. Drawing on the scholarship and children's literature of many cultures and languages, she outlines the constituent areas that structure the field, including contact and transfer studies, intertextuality studies, intermediality studies and image studies. In doing so, she provides the first comprehensive overview of this exciting new research area. Comparative Children's Literature also links the fields of narratology and translation studies, to develop an original and highly valuable communicative model of translation. Taking in issues of children's 'classics', the canon and world literature for children, Comparative Children's Literature reveals that this branch of literature is not as genuinely international as it is often fondly assumed to be and is essential reading for those interested in the consequences of globalization on children's literature and culture.

This student-friendly text on the current economic issues particular to engineering covers the topics needed to analyze engineering alternatives. Students use both hand-worked and spreadsheet solutions of examples, problems and case studies. In this edition the options have been increased with an expanded spreadsheet analysis component, twice the number of case studies, and virtually all new end-of-chapter problems. The chapters on factor derivation and usage, cost estimation, replacement studies, and after-tax evaluation have been heavily revised. New material is included on public sector projects and cost estimation. A reordering of chapters puts the fundamental topics up front in the text. Many chapters include a special set of problems that prepare the students for the Fundamentals of Engineering (FE) exam. This text provides students and practicing professionals with a solid preparation in the financial understanding of engineering problems and projects, as well as the techniques needed for evaluating and making sound economic decisions.

Distinguishing characteristics include learning objectives for each chapter, an easy-to-read writing style, many solved

examples, integrated spreadsheets, and case studies throughout the text. Graphical cross-referencing between topics and quick-solve spreadsheet solutions are indicated in the margin throughout the text. While the chapters are progressive, over three-quarters can stand alone, allowing instructors flexibility for meeting course needs. A complete online learning center (OLC) offers supplemental practice problems, spreadsheet exercises, and review questions for the the Fundamentals of Engineering (FE) exam.

Lean Six Sigma (LSS), Design for Six Sigma (DFSS), and Value Engineering (VE) have a proven track record of success for solving problems and improving efficiency. Depending on the situation, integrating these approaches can provide results that exceed the benefits of each individual approach. Value Engineering Synergies with Lean Six Sigma: Combining Queering the Museum develops a queer analysis of the ways in which museums construct themselves, their core business, and their publics through the, often unconscious, use of inherited ways of knowing and doing. Providing a critique of both the practices and conventions associated with the modern public museum, and the ontological assumptions that inform them, the authors consider recent discourse around inclusion in museums and explore the ways this has been taken up in practice. Highlighting the limits of particular approaches to inclusion, and the failure to move away from a traditional museological paradigm, the book outlines an alternative critical museological approach that the authors refer to as 'queer'. Providing readers with the critical tools necessary for a profound rethinking of museum practice, the book also responds to and problematizes the growing call for social inclusion. Queering the Museum will appeal to academics, students, and museum and arts sector practitioners with an interest in critical theory or queer practice. It will be of particular interest to those working in the fields of museum studies, sociology, archaeology, anthropology, cultural studies, media, social policy, politics, philosophy, and history.

This biography tells the story of Alice May, a touring prima donna in the nineteenth century who travelled from England to Australia, New Zealand, India and the US, taking part in pioneering performances of the popular light operas of the day. Along the way she took part in many premieres, including the first production of Gilbert and Sullivan's *The Sorcerer* and the first authorised American production of *The Mikado*. This colourful life story will appeal to theatre historians, fans of the melodrama, burlesque, and the musical stage.

*Somatechnics* highlights the reciprocal bond between the *sôma* and the *techné* of 'the body' and the techniques in which bodies are formed and transformed as crafted responses to the world around us. Structured around the themes of the governance of social bodies, the gendering of sexed bodies and the techniques associated with the formation of the self, *Somatechnics* presents a groundbreaking study of body modification. Its contributions to the work of Spinoza, Nietzsche, Merleau-Ponty, Deleuze and Guattari make it a must read for scholars of sociology, cultural and queer studies and philosophy.

The majority of professors have never had a formal course in education, and the most common method for learning how to teach is on-the-job training. This represents a challenge for disciplines with ever more complex subject matter, and a lost opportunity when new active learning approaches to education are yielding dramatic improvements in student learning and retention. This book aims to cover all aspects of teaching engineering and other technical subjects. It presents both practical matters and educational theories in a format useful for both new and experienced teachers. It is organized to start with specific, practical teaching applications and then leads to psychological and educational theories. The "practical orientation" section explains how to develop objectives and then use them to enhance student learning, and the "theoretical orientation" section discusses the theoretical basis for learning/teaching and its impact on students. Written mainly for PhD students and professors in all areas of engineering, the book may be used as a text for graduate-level classes and professional workshops or by professionals who wish to read it on their own. Although the focus is engineering education, most of this book will be useful to teachers in other disciplines. Teaching is a complex human activity, so it is impossible to develop a formula that guarantees it will be excellent. However, the methods in this book will help all professors become good teachers while spending less time preparing for the classroom. This is a new edition of the well-received volume published by McGraw-Hill in 1993. It includes an entirely revised section on the Accreditation Board for Engineering and Technology (ABET) and new sections on the characteristics of great teachers, different active learning methods, the application of technology in the classroom (from clickers to intelligent tutorial systems), and how people learn.

This book analyzes China's foreign technology acquisition activity and how this has helped its rapid rise to superpower status. Since 1949, China has operated a vast and unique system of foreign technology spotting and transfer aimed at accelerating civilian and military development, reducing the cost of basic research, and shoring up its power domestically and abroad—without running the political risks borne by liberal societies as a basis for their creative developments. While discounted in some circles as derivative and consigned to perpetual catch-up mode, China's "hybrid" system of legal, illegal, and extralegal import of foreign technology, combined with its indigenous efforts, is, the authors believe, enormously effective and must be taken seriously. Accordingly, in this volume, 17 international specialists combine their scholarship to portray the system's structure and functioning in heretofore unseen detail, using primary Chinese sources to demonstrate the perniciousness of the problem in a manner not likely to be controverted. The book concludes with a series of recommendations culled from the authors' interactions with experts worldwide. This book will be of much interest to students of Chinese politics, US foreign policy, intelligence studies, science and technology studies, and International Relations in general.

The Economics of Empire: Genealogies of Capital and the Colonial Encounter is a multi-disciplinary intervention into postcolonial theory that constructs and theorizes a political economy of empire. This comprehensive collection traces the financial genealogies associated with the colonial enterprise, the strategies of economic precarity, the pedigrees of capital, and the narratives of exploitation that underlay and determined the course of modern history. One of the first attempts to take this approach in postcolonial studies, the book seeks to sketch the commensal relation—a symbiotic "phoresy"—between capitalism and colonialism, reading them as linked structures that carried and sustained each other through and across the modern era. The scholars represented here are all postcolonial critics working in a range of disciplines, including Political Science, Sociology, History, Peace and Conflict Studies, Legal Studies, and Literary Criticism, exploring the connections between empire and capital, and the historical and political implications of that structural hinge. Each author engages existing postcolonial and poststructuralist theory and criticism while bridging it over to research and analytic lenses less frequently engaged by postcolonial critics. In so doing, they devise novel intersectional and interdisciplinary frameworks through which to produce more greatly nuanced understandings of imperialism, capitalism, and their inextricable relation, 'new' postcolonial critiques of empire for the 21st century. This book will be an excellent resource for students and researchers of Postcolonial Studies, Literature, History, Sociology, Economics, Political Science and International Studies, among others.
