This book is perhaps the most stunning available demonstration of the explanatory power of the parametric approach to linguistic theory. It is akin, not to a deductive proof, but to the discovery of a footprint in a far-off place which leaves an archeologist elated. The book is full of intricate reasoning, but the stunning aspect is that the reasoning moves between not only complex syntax and diverse languages, but it makes predictions about what two-year-old children will assume about the jumble of linguistic input that confronts them. Those predictions, Hyams shows, are supported by a discriminating analysis of acquisition data in English and Italian. Let us examine the linguistic context for a moment before we discuss her theory. The ultimate issue in linguistic theory is the explanation of how a child can acquire any human language. To capture this fact we must posit an innate mechanism which meets two opposite constraints: it must be broad enough to account for the diversity of human language, and narrow enough so that the child does not make irrelevant hypotheses about his own language, particularly ones from which there is no recovery. That is, a child must not posit a grammar which permits all of the sentences of a language as well as other sentences which are not in the language. In a word, the child must not create a language in which one cannot make adult discriminations between grammatical and ungrammatical.

This collection of recent papers in Laboratory Phonology approaches phonological theory from several different empirical directions.

Psycholinguistic research into the perception and production of speech has produced results that challenge current conceptions about phonological structure. Field work studies provide fresh insights into the structure of phonological features, and the phonology-phonetics interface is investigated in phonetic research involving both segments and prosody, while the role of underspecification is put to the test in automatic speech recognition.

Tone: A Linguistic Survey is a nine-chapter text that considers the phonetics and phonology of tone from both a synchronic and a diachronic point of view. The first chapters deal with the physiological and perceptual correlations of tone. These chapters also describe the interactions of tonal and nontonal features. The succeeding chapters provide the phonetic basis for phonological tonal phenomena. These topics are followed by discussions of the physical and physiological aspects of tone, the number of possible contrastive tones in a language, and a suprasegmental representation of tones based on linguistic evidence. This text also summarizes the kinds of tone rules found in languages and the important syntactic function played by tone in a number of the world's languages, particularly those in Africa. The final chapters look into the general and specific principles that constrain historical tone change. This book will prove useful to students with phonology course.
