In service societies, the tertiary sector has long become the primary sector in terms of GDP and employment. Quality research and testing means better service, and success in the service industries demands quality. Nonetheless, complaints about insufficient, inconsistent or bad service abound. Quality decides on success and failure. Where so much is at stake, management decisions call for systematic research and consumers look for relevant results that provide guidance in complex markets. Research into quality and customer satisfaction gets to the core of a business. However, many so-called studies hardly meet essential criteria of empirical research and deliver artefacts rather than facts. This book puts an end to common misconceptions of quality studies. Measuring Service Performance is an appeal for an approach to quality research that meets quality criteria itself. It is a compelling argument against widespread but rather dubious dealings with measurement, data and statistics. Ralf Lisch calls for a reconsideration of the research process, focussing on content instead of method and adding meaning to results. Because service excellence deserves research excellence. Written in a practical, accessible style, the book offers practitioners as well as market researchers, MBA students and others involved in the service sector a critical analysis and discussion of the essentials of 'Practical Research for Better Quality'.

When Crime and Personality was first published in 1964, J.A.C. Brown, writing in the New Statesman, commented: 'There can be no doubt of the importance of Professor Eysenck's book on the nature and treatment of criminal behaviour.' This third edition, originally published in 1977, had been completely revised and brought up to date, and although the major theory linking personality and crime has been retained, many of the details have been changed in conformity with recent research of the time. The book presents a theory concerning the personality of criminals, and offers evidence to show that these personality features characterising criminals are based on genetic foundations. It is argued that criminality as a whole is not exclusively based on environmental factors as has so often been suggested, but has a strong biological basis. A good deal of evidence is reviewed showing that there are many data supporting this view, from studies of identical and fraternal twins, adopted children, and comparisons between criminals and non-criminals both in the Western world and in Communist countries. Professor Eysenck suggests that important consequences follow from such an attempt to redress the

one-sided emphasis on environmental factors which had been so characteristic of the previous fifty years, and some of these consequences are described in detail. He further suggests that only proper understanding of the psychological factors making for antisocial behaviour will help in reversing the increasing burden that criminality places upon society. The book also takes issue with political arguments of the time regarding the origins of criminality, and shows that criminals behind the Iron Curtain show the same personality characteristics as do criminals in Western countries.

A Fateful Meeting A year and a half ago, I was sitting at a conference listening to Ed Noffsinger speak, and suddenly had the most profound “Aha” moment of my professional career. Here was someone presenting a practical and tested solution to some of the most challenging problems currently plaguing the US healthcare system, problems such as poor access to primary and specialty care; the uncontrollable and rising costs of healthcare; our nation’s relatively poor quality outcomes; and finally, the sense of frustration, disempowerment, loneliness, and disenfranchisement that patients and their families too often experience. Dr. Noffsinger’s solution seemed deceptively simple—shared medical appointments (SMAs) that afford the highest quality healthcare to be delivered in the highest quality care experience—a group setting. Experience collected over a decade and involving more than 100,000 patient visits throughout the United States, Canada, and parts of Europe has demonstrated that SMAs, when used in primary care as well as in the medical and surgical subspecialties, lead to increased access to care, enhanced quality of care, and improved patient satisfaction. For physicians, the efficiency gains and team support from their participation in SMAs translate into much needed relief and improved career satisfaction.
