Horticulture is fast emerging as a major commercial venture, because of higher remuneration per unit area and the realization that consumption of fruits and vegetables is essential for health and nutrition. In the last one decade, export potential of horticultural crops has significantly increased attracting even multinationals into floriculture, processing and value added products. Since the horticultural produce especially fruits and vegetables are consumed afresh, consumers expect residue-free produce. In modern society where consumers are becoming increasingly health conscious and environmentally aware, a major market for organic foods has developed. The organic sector, in particular, has sprung back into life to become one of the most dynamic sectors in the international food market. The present book is an attempt which comprehensively deals with both principles and practices. It is divided into two parts. The first part deals with the principles of organic farming covering aspects such as enrichment of soil with organic matter, cropping systems, bio-fertilizers, weed management and pest management. The second part of the book deals with package of practice for organic farming in fruits, vegetables, ornamentals, medicinal, aromatic, plantation, spice and tuber crops. Three aspects, namely - nutrient management, weed management and pest management are dealt with separately for each crop. An entire chapter is devoted for

sources of critical inputs used for organic farming which would be very much useful to the organic farmers to procure the same. This book is a practical guide to practicing organic farmers of horticulture crops. Further, it is a useful reference to policy makers, research workers and students. The material can also be used for teaching undergraduate and post-graduate courses. Today, many economically important agricultural, horticultural and ornamental crop plants are attacked by various soil borne and foliar diseases, resulting in billions of dollars in crop losses. Currently, the most widely used disease management strategy is the use of chemical fungicides. However, the use of these fungicides has encountered problems, such as development of resistance by pathogen to fungicides and rapid degradation of the chemicals. Other factors leading to increased interest in alternatives include the increasing cost of soil fumigation, lack of suitable replacements for methyl bromide and public concerns over exposure to fungicides. Both the agriculture and agri-food sector are now expected to move toward environmentally sustainable development, while maintaining productivity. These concerns and expectations have led to renewed interest on the use of “biologically based pest management strategies”. The green revolution of agriculture brought an enormous increase in food production. It not only made the world self sufficient in food but also gave the world’s scientists and farmers an immense amount of self-respect. Though the green revolution did increase food production, the productivity levels have remained low and increase was achieved at

a cost of intensive use of water, fertilizer and other inputs which have caused problems of soil salinity, ground water pollution, nutrient imbalances, emergence of new pest and diseases and environmental degradation.

This book examines the production, procurement and marketing aspects of the organic produce sector with the focus on marketing agencies and producers in each commodity/product chain. It analyses the various institutional arrangements like contract farming, networking and producer level co-ordination prevalent in this sector. Based on case studies of various type of organic players in India, both in export market as well as in domestic market.

In a Tirio village deep in the heart of the Amazon rain forest, the shaman Nahtahlah has a place of honor in his tribe. Young Kamanya wants to learn the healing secrets of the forest plants--he hopes that he, too, will become the tribe's shaman, so that he can cure his people.

When the villagers fall sick with an illness that Nahtahlah cannot cure, many lose faith in the shaman's wisdom--until a foreign woman helps them understand its value while giving Kamanya an opportunity to realize his dream. Lynne Cherry returns to the rain forest with ethnobotanist Mark J. Plotkin to tell an important story about the healing plants of the earth--and why we must protect them.

Is organic agriculture a myth or mystery? The havoc caused by the inadvertent ushering in Green Revolution is miserable because of the use of harmful chemicals like fertilizers, pesticides and weed killers. They have caused innumerable diseases such as blood pressure, diabetes and cancer. The health of soil and the lives of the future generations of human beings are at stake. The time has come to realize the paramount importance of Organic Agriculture to save the soil, water, environment and the living beings of earth. The days of bulky organic manures such as farmyard manure, compost etc. are gone. It is

possible to convert the conventional chemical farm into an organic one. The yield and quality of the organically produced foods have better grade in flavor, aroma, color, taste and nutrition. This book aims at spreading the importance and adoption of organic cultivation which is the most urgent need of the hour to save the humanity. This Book aims at strengthening the scientific basis for sustainable development. Scientists are improving their understanding about Nature. Technologists are harnessing the potential and resources for economic growth. Scientists, through increased research, can provide efficient techniques for supporting the prudent management of the environment. The uses of remote sensing techniques, efficient materials, application of polymer technology, alternative energy forms, etc., are other topics of discussions included in the book.

been and will continue to be the lifeline of the Indian economy in the foreseeable future. However due to urbanization, agricultural land is shrinking and human population is increasing year by year. So, there is a need for vertical increase in agricultural produce to feed the increasing population. Due to changing climatic conditions, there is a need for reorientation of presently practiced agricultural technologies. At the same time there is a need to save/conserves the natural resources. Crop yields can be improved with the adoption of improved production and protection technologies for raising field crops. In order to increase profit in agriculture, the farm inputs like fertilizers, irrigation water, pesticides etc. must be used judiciously and more stress should be laid on conservation agriculture. The book covers basic but very comprehensive information on history of agriculture and role of Agronomy, tillage practices, nutrient elements for plant growth, weeds and their management, irrigation management, crop physiology, crop ecology, integrated farming system and organic farming. A detailed information on history and origin, improved varieties, agronomic practices and plant protection techniques for important field crops viz. cereals, oilseeds, pulses, sugar crops and fibre crops has been given. Also information on cultivation practices for important medicinal, aromatic, spice crops as well as plantation crops along with their uses/medicinal values has been provided. This book will be very helpful for B.Sc. Agriculture students throughout the country as it covers nearly the entire syllabus for Agronomy courses framed by ICAR as suggested by 4 th Dean's

There is a lot of confusion in alternative agricultural systems being promoted in India and elsewhere. Though, a large amount of valuable information is generated, it is very much scattered and becomes difficult to the readers to locate them under one roof. Hence, in this book an attempt has been made to compile and present the available information on sustainable agriculture under various chapters. The book is sub-divided into nine chapters which starts with an introductory picture covering the scope, need and meaning of sustainable agriculture. It gives the readers a clean understanding of the definition of the term sustainable and its usage in a broadened horizon. Owing to its systematic, in-depth and critical arrangement of the valuable information, upon completing the book, the reader will have a feeling of an enrichment of his knowledge in the field of sustainable agriculture in its right perspective. This open access book provides both a broad perspective and a focused examination of cow care as a subject of widespread ethical concern in India,

and increasingly in other parts of the world. In the face of what has persisted as a highly charged political issue over cow protection in India, intellectual space must be made to bring the wealth of Indian traditional ethical discourse to bear on the realities of current human-animal relationships, particularly those of humans with cows. Dharma, yoga, and bhakti paradigms serve as starting points for bringing Hindu--particularly Vaishnava Hindu--animal ethics into conversation with contemporary Western animal ethics. The author argues that a culture of bhakti--the inclusive, empathetic practice of spirituality centered in Krishna as the beloved cowherd of Vraja--can complement recently developed ethics-of-care thinking to create a solid basis for sustaining all kinds of cow care communities. ; Offers a focused insight into a key aspect of Hindu religious practice Integrates primary research and tertiary sources to give a multifaceted understanding of the intricacies of cow care practice Challenges conventional Western thought on cow care and its worldwide implications for animal ethics. The book covers basic but very comprehensive information on history of agriculture and relationship of Agronomy with other disciplines, tillage practices, nutrient elements for plant growth, weed and their management, irrigation management, crop physiology, crop ecology, integrated farming system and organic farming. Also information on cultivation practices for important medicinal, aromatic and spice crops as well as plantation crops along with their uses/medicinal values has been provided. Apart from this, information on dry land agriculture, crop production under special situations and hints for achieving higher yield of field crops are also given in details. Biocharculture - Biochar for Environment and Development is the book based on the author's over a decade firsthand experience in research, development and use of biochar. Much of his overall insights and firsthand experiences have become available through this book. Biocharculture falls very much in a vision of an agriculture that supports and makes use of natural growing mechanism. Biochar is charcoal that is used for other purposes than heating. It can be a by-product or part of an entire production system. Biochar scores on many fronts: it improves the capacity of the soil to retain moisture but also nutrients, such as nitrogen and phosphorus. It helps regulate soil temperature and contribute to

climate change mitigation. It improves soil life. I still remember that Sai Bhaskar explained a tiny piece of charcoal to me as being a ‘skyscraper for millions of soil biota’. There is still a world to gain – by better understanding this miraculous microbial world and the way our soils and landscapes work and this book hopes to contribute and give practical suggestions and directions. Interesting in some parts of the world biochar is part of the production process wherein other it is not. In other words, we need to create new traditions and farming cultures, as this book very much argues. One learns everything about biochar and its uses through this book.

In this meditation, respected Ugandan academic Dani Wadada Nabudere traces the roots of the global economic crisis and warns of the threat that the decline of Western nations poses to the African continent—the final frontier for those in search of new lands and resources to exploit. As a deterrent to what he sees as the encroachment of super-profiters looking to Africa for the land to increase their profits in industrial agriculture, Nabudere advocates for what he terms “community sites of knowledge,” that is, the use of indigenous tools and knowledge to revitalize the lives of Africa’s people. The book puts forth the belief that any dependence on imported knowledge and material instruments will only lead to the entrenchment of colonial stereotypes, and that indigenous knowledge is

imbued with the roots of “complex ecosystems” that require the inputs of a diversity of expertise and experiences and that are capable of producing the knowledge necessary for the residents of the African continent to reclaim the future.

Sustainable agriculture is a rapidly growing field aiming at producing food and energy in a sustainable way for our children. This discipline addresses current issues such as climate change, increasing food and fuel prices, starvation, obesity, water pollution, soil erosion, fertility loss, pest control and biodiversity depletion. Novel solutions are proposed based on integrated knowledge from agronomy, soil science, molecular biology, chemistry, toxicology, ecology, economy, philosophy and social sciences. As actual society issues are now intertwined, sustainable agriculture will bring solutions to build a safer world. This book series analyzes current agricultural issues and proposes alternative solutions, consequently helping all scientists, decision-makers, professors, farmers and politicians wishing to build safe agriculture, energy and food systems for future generations.

Hinduism is not a religion in the strictest sense of the term, but it is a way of life. A religion is that which has one religious book and one founder like Christianity and Islam. When we look at Hinduism it is like a vast and huge banyan tree, under which many religions took their root and prospered. If such religions could not make much headway or declined, it was not due to Hinduism, but due to their own limitations and

deficiencies. In this book, I have laid stress on some exclusive characteristic features of Hinduism which distinguish it from other religions, though some fundamental traits are common to almost all the religions. I have tried my best to avoid controversial topics, especially that create dissensions amongst other religions but, even then, some references were unavoidable. But there is no overt or covert intention to deride and demean any religion. When salient features of a religion are mentioned, comparison cannot be avoided, nor even over looked, as comparative study enables us to discern between good and bad.

This edited volume is a comprehensive account of plant diseases and insect pests, plant protection and management for various crops using microbial and biotechnological approaches. The book elucidates the role of biotechnology for the enhancement of crop productivity and management of bacterial and fungal diseases via eco-friendly methods. It discusses crop pest pathogen interaction and utilizing this interaction in a beneficial and sustainable way. This book is of interest to teachers, researchers, plant scientists and plant pathologists. Also the book serves as additional reading material for undergraduate and graduate students of agriculture, forestry, ecology, soil science, and environmental sciences.
