Besides, inclusion of these chapters makes this book a handy guidebook to the students of agricultural engineering. It covers most issues of interest for the students in an easy to understand manner. The textbook has a total of 32 Chapters, divided into four sections. The book begins with a section on Engineering Survey having 10 chapters. Farm development is grouped into five chapters and includes issues such as land levelling, groundwater and pumps, open and underground conveyance systems and farm drainage. The third section on irrigation water management is divided into 6 chapters. The section on soil and water conservation engineering is the largest section divided in 11 chapters. This section can serve as an independent textbook in several universities that have made soil and water conservation engineering a separate one semester course. Objective type questions, glossary of terms and subject index are included. Besides serving as a text book, it will prove to be a handy resource book to conduct specialized training programs on soil and water management.

This book will find its due place in the shelves of students and teachers, field functionaries and college libraries of state agricultural universities, deemed universities and engineering colleges. In this volume, the erosion and conservation measures discussed are, for the most part, those under unirrigated agriculture. The use of irrigation could cause significant changes in the growing seasons, and in the agricultural calendar, especially in the warmer climates where temperature is not a limiting factor. It is further noted that much of the material in this volume has been prepared with the developing countries of the so-called Third World in mind. In many of these

countries there is a dearth of basic data, such as long-term hydrological records, detailed soil and topographic surveys, and experimental results for various types of erosion control measures. Some design procedures cannot be imitated or copied directly from those of the technologically more advanced countries. Consequently, emphasis will be placed, wherever possible, upon simple empirical methods of design, and approximate solutions within the limitations of the available data, technical possibilities, and financial resources of the Third World countries. Much of the numerical data and calculations will be presented in the metric system.

Modeling aspects have added a new dimension in research innovations in all branches of engineering. In the field of soil and water engineering, they are increasingly used for planning, development, and management of land and water resources, including analysis of quantity and quality parameters of surface and ground water, flood forecasting and control measures, optimum allocation and utilization of irrigation water. The application of these models saves considerable time in decision support systems and helps in conservation and optimum allocations of scarce precious natural resources.

A comprehensive engineering guide to theory and design practices for the control, utilization, and management of water in agriculture, with emphasis on scientific principles. Integrates into a single volume engineering practices for solving problems relating to erosion control, flood control, drainage, and irrigation. Presents information on precipitation, infiltration, evapotranspiration, and runoff, in addition to providing the entire design data for the U.S., plus a wide range of its applications. Contains conversion tables from English units to SI, and SI to English units, as well as numerous example problems, illustrations, and appendix.

Emphasizes engineering design of soil and water conservation practices and their impact on the environment, primarily air and water quality. As in previous editions, the purpose of this book is to provide a professional text for undergraduate and graduate agricultural and biological engineering students and for others interested in soil and water conservation in rural and urban areas. Subject matter includes all the engineering phases of soil and water conservation for a one- or two-semester course.

About The Book: This book combines engineering practices for the solution of erosion and flood control, drainage and irrigational problems. Sufficient hydrologic information--precipitation, infiltration, evaporation, transpiration and runoff--is given as background for design problems discussed later. The text makes readers aware that the environment must be considered in the design of soil and water facilities. It also features many example problems, with detailed solutions, to facilitate learning.
