Maps capture data expressing the economic complexity of countries from Albania to Zimbabwe, offering current economic measures and as well as a guide to achieving prosperity Why do some countries grow and others do not? The authors of The Atlas of Economic Complexity offer readers an explanation based on "Economic Complexity," a measure of a society's productive knowledge. Prosperous societies are those that have the knowledge to make a larger variety of more complex products. The Atlas of Economic Complexity attempts to measure the amount of productive knowledge countries hold and how they can move to accumulate more of it by making more complex products. Through the graphical representation of the "Product Space," the authors are able to identify each country's "adjacent possible," or potential new products, making it easier to find paths to economic diversification and growth. In addition, they argue that a country's economic complexity and its position in the product space are better predictors of economic growth than many other well-known development indicators, including measures of competitiveness, governance, finance, and schooling. Using innovative visualizations, the book locates each country in the product space, provides complexity and growth potential rankings for 128 countries, and offers individual country pages with detailed information about a country's current capabilities and its diversification options. The maps and visualizations included in the Atlas can be used to find more viable paths to greater productive knowledge and prosperity.

Since the 1950s, under congressional mandate, the U.S. National Science Foundation (NSF) - through its National Center for Science and Engineering Statistics (NCSES) and predecessor agencies - has produced regularly updated measures of research and development expenditures, employment and training in science and engineering, and other indicators of the state of U.S. science and technology. A more recent focus has been on measuring innovation in the corporate sector. NCSES collects its own data on science, technology, and innovation (STI) activities and also incorporates data from other agencies to produce indicators that are used for monitoring purposes - including comparisons among sectors, regions, and with other countries - and for identifying trends that may require policy attention and generate research needs. NCSES also provides extensive tabulations and microdata files for in-depth analysis. Capturing Change in Science, Technology, and Innovation assesses and provides recommendations regarding the need for revised, refocused, and newly developed indicators of STI activities that would enable NCSES to respond to changing policy concerns. This report also identifies and assesses both existing and potential data resources and tools that NCSES could exploit to further develop its indicators program. Finally, the report considers strategic pathways for NCSES to move forward with an improved STI indicators program. The recommendations offered in Capturing Change in Science, Technology, and Innovation are intended to serve as the basis for a strategic program of work that will enhance NCSES's ability to produce indicators that capture change in science, technology, and innovation to inform policy and optimally meet the needs of its user community.

The world economy is experiencing a very strong but uneven recovery, with many emerging market and developing economies facing obstacles to vaccination. The global outlook remains uncertain, with major risks around the path of the pandemic and the possibility of financial stress amid large debt loads. Policy makers face a difficult balancing act as they seek to nurture the recovery while safeguarding price stability and fiscal sustainability. A comprehensive set of policies will be required to promote a strong recovery that mitigates inequality and enhances environmental sustainability, ultimately putting economies on a path of green, resilient, and inclusive development. Prominent among the necessary policies are efforts to lower trade costs so that trade can once again become a robust engine of growth. A compelling argument for why stewardship of wealth and service to others should be our highest financial priority Stewardship is the journey of financial insider John Taft towards understanding and affirming the importance of stewardship—which he has come to define as "serving others"—as a core principle for the financial services industry, the global financial system, and society at large. By defining the attributes of authentic stewardship, this book presents a path forward by analyzing the success of Canadian banks in weathering the financial crisis; evaluates the effectiveness of global financial reform efforts in making the financial system safer, sounder, and more secure; offers wealth management prescriptions for individual investors;

evaluates the potential of ESG (environmental, social, and governance) investment processes as a way to instill stewardship behaviors among corporate CEOs (particularly at financial services firms); and, ultimately, calls for a return to stewardship's core principles as the key to not only minimizing the scope and consequences of future failures, but also to addressing other societal challenges. Argues for a return towards stewardship, with financial services companies doing right by their customers Analyzes the response of Canadian banks to the financial crisis to provide meaningful advice for investors and businesses alike Inspired by Taft's experience running one of the largest wealth management firms in the country during the financial crisis and his direct participation in subsequent legislative and regulatory efforts to rewrite the rules under which the U.S. securities industry operates From the man who made the decision to reimburse clients affected by the collapse of a money market mutual fund comes a compelling look at why financial service companies should start doing what's right for their customers.

Historically, national security includes the strength of our nation's infrastructure, the foundation upon which the continuous growth of our society depends. This includes our strong societal and moral codes, the rule of law, stable government, social, political, and economic institutions, and leadership. Also included are our nation's schools and educational programs to ensure a knowledgeable citizenry and lifelong learning—a must for a democracy. Our nation's strength also requires investments in science, engineering, research and development, and technological leadership. We cannot be strong without a viable way to power our cities, feed ourselves, and move from one place to another. Most of all, a strong economy is an essential ingredient of a global superpower. Without it, we will lose our superpower status, and quickly. National security must include a healthy market-based economy, with a strong base of globally competitive products and services that produce jobs. This economy must include sound government policies to promote responsible choices and reduce our debt, and grand strategies for energy and environmental sustainability, science and technology leadership (at least in some areas), human capital capabilities, manufacturing, and the industrial base. And these are not the only components. National security goes to the very core of how we define who we are as a people and a free society. It concerns how we view our world responsibilities. Economic security is a major element of national security, even as borders are less important than ever. No matter how we look at national security, there can be no question of the need to include the economic viability of our nation. Without capital, there is no business; without business, there is no profit; without profit, there are no jobs. And without jobs, there are no taxes, and there is no military capability. The viability of a nation's industrial infrastructure, which provides jobs for its people, creates and distributes wealth, and leverages profits, is essential. Without jobs, the quality of peoples' lives deteriorates to a point where society itself can disintegrate. It can also lead to strife on many different levels. As a nation, we need to find a strategy to deal with this, and we will discuss the ideas of expeditionary economics. But poverty is not only a problem in Third World countries. It can occur at home, too—especially during a deep recession. No community, local or global, can sustain indefinitely whole populations of "haves" and "have nots." And that gap is now growing within the United States. There is no question that a part of the infrastructure of a nation must include a sound economy. It was the relative deterioration of the Japanese and German economies that led those nations into World War II. Poverty around the world is a global systemic issue that frequently can and does lead to political instability. But we cannot help others if we cannot help ourselves, and our current economic crisis is a warning. National security is societal, political, and economic strength. In today's world, national security for a superpower is meaningless without a strong military capability as well. The sovereignty and security of the United States, and the protection of its citizens and property around the world, remain the bedrock of national security. The execution of U.S. national security strategy is conducted in a highly volatile global environment characterized by quantum changes in technology; unprecedented social, economic, and political interdependencies; broadened opportunities to foster democratic principles; and allegiances and alliances frequently founded on interests other than traditional nationalism. Understanding the complex systems nature of national security and why the economy is a part of the equation is crucial. National Defense University.

The story of this book began with my difficult transition from teaching international economics and econometrics in Economics Ph. D. programs at Harvard and UCLA to teaching in the MBA programs at the Anderson School at UCLA. On the basis of 20 years of apparent teaching success in Ph. D. education, I arrived at the Anderson School in 1990 with a self-image as a star teacher, but I was greeted with highly disturbing mediocre teaching evaluations. Faced with a data set that was inconsistent with my view of reality, I did what analysts usually do – I formulated a theory why the data were misleading. Here is how I thought about it. Two aspects of the course – content and amusement – drive numerical course evaluations. If you rank courses by the average of the content score and the amusement score, then the component that can be measured most accurately will determine the ranking. Do you understand why? It is what - eraging does: it eliminates the noise. Suppose, for example, that a student cannot tell anything about the content, and the content score is simply a random number, varying from student to student. Those random numbers will average out across students to about the same number for each course. As the average course content score is about the same for every course, it is the amusement score that will drive the rankings.

For years, investors, business strategists, and policymakers worldwide have turned to one book to help them translate the massive flow of economic data into knowledge for intelligent decision-making. As President Obama's time in the White House draws to a close, this celebratory book documents his transformative accomplishments. Evidence indicates President Barack Obama has been tremendously successful and effective by objective measures. On economic indicators alone, he is credited with the longest streak of job growth in U.S. history, a two-thirds reduction in the federal budget deficit, and the rebounding of the stock market to record highs following the record lows of the recession under his predecessor. His victories have come against a backdrop of criticism and sometimes open defiance from conservatives, lack of cooperation in Congress, and racially tinged commentary in traditional and social media. Through it all, the President who campaigned on a slogan of "Yes, We Can!" has persevered in his determination to make a difference and left an indelible mark on American politics and the world. LEGACY is a commemoration of his eight years in the White House.

The most powerful force in the world economy today is the redefinition of the relationship between state and marketplace - a process that goes by the name of privatization though this term is inadequate to express its far-reaching changes. We are moving from an era in which governments sought to seize and control the 'commanding heights' of the economy to an era in which the idea of free markets is capturing the commanding heights of world economic thinking. Basic views of how society ought to be organized are undergoing rapid change, trillions of dollars are changing hands and so is fundamental political power. Great new wealth is being created - as are huge opportunities and huge risks. Taking a worldwide perspective, including Britain, where the process began with Mrs Thatcher, Europe and the former USSR, China, Latin America and the US, THE COMMANDING HEIGHTS shows how a revolution in ideas is transforming the world economy - why it is happening, how it can go wrong and what it will mean for the global economy going into the twenty-first century.
